

PIPPACKER

The **newest** development in the CIPP Industry.

Reline through bends, traps, junctions, voids without the fear of a blow out or wrinkled bends.

PIP is the easy-to-use packer that uses a Patented multi-dimensional sleeve or jacket to allow superior safety and performance in a wider range of relining applications.

A little bit about PIP Packer.

PIP is a patented solution that enables the user to complete most types of relining work. PIP is a cost-effective system that can allow you to make a profit on your very first job. PIP is simple, reliable, and versatile providing outstanding results.

PIP Evolved on the back of 20 years of relining experience. Designed to overcome the difficulties faced using traditional systems.

With challenges including tight access, dimensional changes, differences between pipes made of different materials, blowouts, wrinkles on bends, start up costs, and inserting the bladder into transitional liners. These have all been overcome by the development of PIP.

PIP was born out of the need to complete most types of relining work more effectively. The people who developed PIP have been in the relining industry since the very early 2000's and found the systems on offer were much too restrictive and inadequate. Other Pull IN Place systems are unable to do what PIP allows you to do, with PIP you will be able to be more competitive.

With many years of experience in using all types of reline installation technology, I can say that the PIP Packer is the most versatile packer available on the market.

Components.

Made from components manufactured to the highest quality in both Australia and abroad to be stronger and easier to use in a wider range of situations.

01 The PIP 1 (jacket) system

- Two PIP packer heads, suited to either air and steam, or flow and return hot water
- Rubber tube
- A multi-dimensional PIP jacket clamped to the PIP packer heads
- A polybag

02 The PIP 2 (sleeve)

- Two PIP packer heads suited to either air and steam, or flow and return hot water
- Rubber tube with an internal strap
- Multi-dimensional PIP sleeves clamped to the PIP packer heads
- A polybag

Application.

We have created the most versatile pull in place system in the industry, it can be used where other systems cannot including:

- Entering the packer through smaller diameter pipes to reline larger ones downstream; this includes the safe retrieval of the packer afterwards
- Packers are now fully protected and contained allowing for no possibility of 'blowouts' near/over junctions
- The system is extremely strong and durable; the jacket system in particular can be used multiple times
- The jackets and sleeves are stronger, softer and more elastic than traditional vinyl products allowing for easier fabrication, better finished relining results and safer operation of high pressures

SIMPLE. RELIABLE. VERSATILE.

Simple. Reliable. Versatile.

Advantages: Stronger – Easier – Multi-dimensional – Multiple Cure

- P** Other packers can be stiff and difficult to use
- P** Other systems can leave wrinkles and creases
- P** Other bladders can over inflate near openings
- P** Smaller bullet package means easier to insert through liner
- P** Smaller package means easier to insert into pipe in tight spots
- P** Sleeve and Jacket are suitable to use on bends
- P** Safe in a void or junction

“Over the last two years I was lucky enough to be involved in the jobsite testing stage of PIP Packers journey to becoming a Patented product. I found the ease of use, long term cost savings and knowledge and support of the product developers to be highly beneficial to my relining business. After using different packers and installation over my years of relining, it was so refreshing to find the PIP Packer allowed me to complete jobs that seemed impossible using the packers of the past.”

Contact.

Our relining product experts are based in Sydney. They're here to help you, on the phone, email or chat within this website.
